# STRUCTURE

# JAVASCRIPT API

Get variables:  
getConfig()  
getPlaylist()

Subscribe to events:  
addModelListener(event,function)  
addControllerListener(event,function)  
addViewListener(event,function)

Send (view) events:  
ply.sendEvent(event,value)

Note that there's no fullscreen event in javascript.

# MISCELLANEOUS

Instead of declaring a list of flashvars in HTML, one could also use an XML file that contains all flashvars in nodes and assign this to the player with the **config** flashvar.

The **state** event can have the values IDLE, BUFFERING, PLAYING, PAUSED and COMPLETED in its **newstate** and **oldstate** variables.

The **load** event's **object** can be a single url string, an object with playlist elements (file,title,author,etc.) or a complete playlist array with objects.
